

Here you can find the result of my work: <http://selenespaziano.com/MediaOrganiser>

This application allows you to upload, edit and delete files, create, edit and delete a playlist and also add files to playlists. It works pretty well, but only with audio files. I will still need to implement:

- delete the images when update files
- add video files and create playlists with them
- allow to choose more than one category for each file
- not allow to choose the same file or playlist title when updating
- some style to make the UI more appetible
- some work on the redirection of some pages, adding some links to go back to other pages, especially from playlist.php
- login feature so more users can use the same application

The application is very simple to use.

If you click on the link “Media Files” in the nav-bar, it will show a form that you can use to upload a file choosing a title and, optionally, add a comment, image and a category. It will also show a list of file and you can play and pause them. If you’re not happy, you can click on “Edit” and there you can update the information about that file”.

If you click on the link “Playlists” in the nav-bar, it will show a form to add a new playlist, plus another form to add files to a playlist that you can choose from the dropdown menu and a list of playlists with links to go and play them and links to edit or delete them. When you click on a link with the playlist title, you’ll access to a media player to play your music, underneath you have a list of playlists, but also, on the same page, you can add new files to the playlist, but you will be redirect to another page. You can always go back to that playlist clicking on the link in the list of playlists.
